

PRODUCT DESCRIPTION

Bridge Preservation™ Blister Repair Kit is a portable repair kit intended to repair the waterproofing membrane after asphalt has been placed, that includes a needle, syringe, and BD Patch Coat SC (a single component repair material). When used, the repair material restores the integrity of the waterproofing membrane by filling the blister void, re-adhering the membrane layers, and sealing the hole used to relieve the pressure.

USES

Bridge Preservation™ Blister Repair Kit is used to pierce blisters that may form in a waterproofing membrane, allowing pressure to be released. Once pierced, BD Patch Coat SC repair material is injected, adhering the layers and sealing the opening.

DIRECTIONS FOR USE

1. Locate blister(s) and mark for repair.

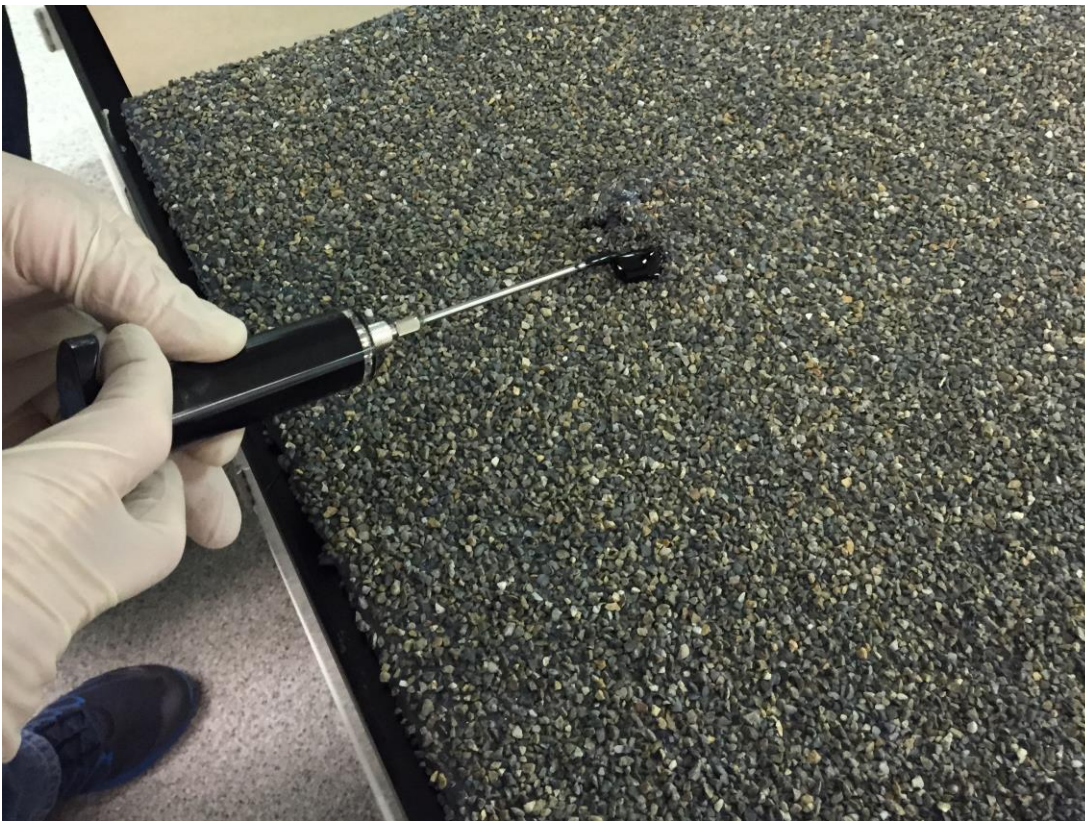

2. Attach provided needle to syringe.
3. Pour Bridge Preservation™ BD Patch Coat SC single component repair material into syringe and close top.

4. Insert needle into blister to relieve pressure buildup.

5. Once pressure is relieved, press down plunger to inject BD Patch Coat SC repair material into blister area.

6. Remove needle and allow paving operations to continue.
